

# Migration from the MENA

Workshop, May 31st 2024

## Osmosis within the MENA Countries: Have Migration Root Drivers Changed?

**Hafidha Lahmeri**

PHD Student, Mustapha Stambouli Mascara – Algeria

# A Zoom on the MENA

# Dimensions and Drivers

*‘Demographic and socioeconomic trends, conflict and, increasingly, climate change are among the multitude of factors that influence migration dynamics in the region ’*

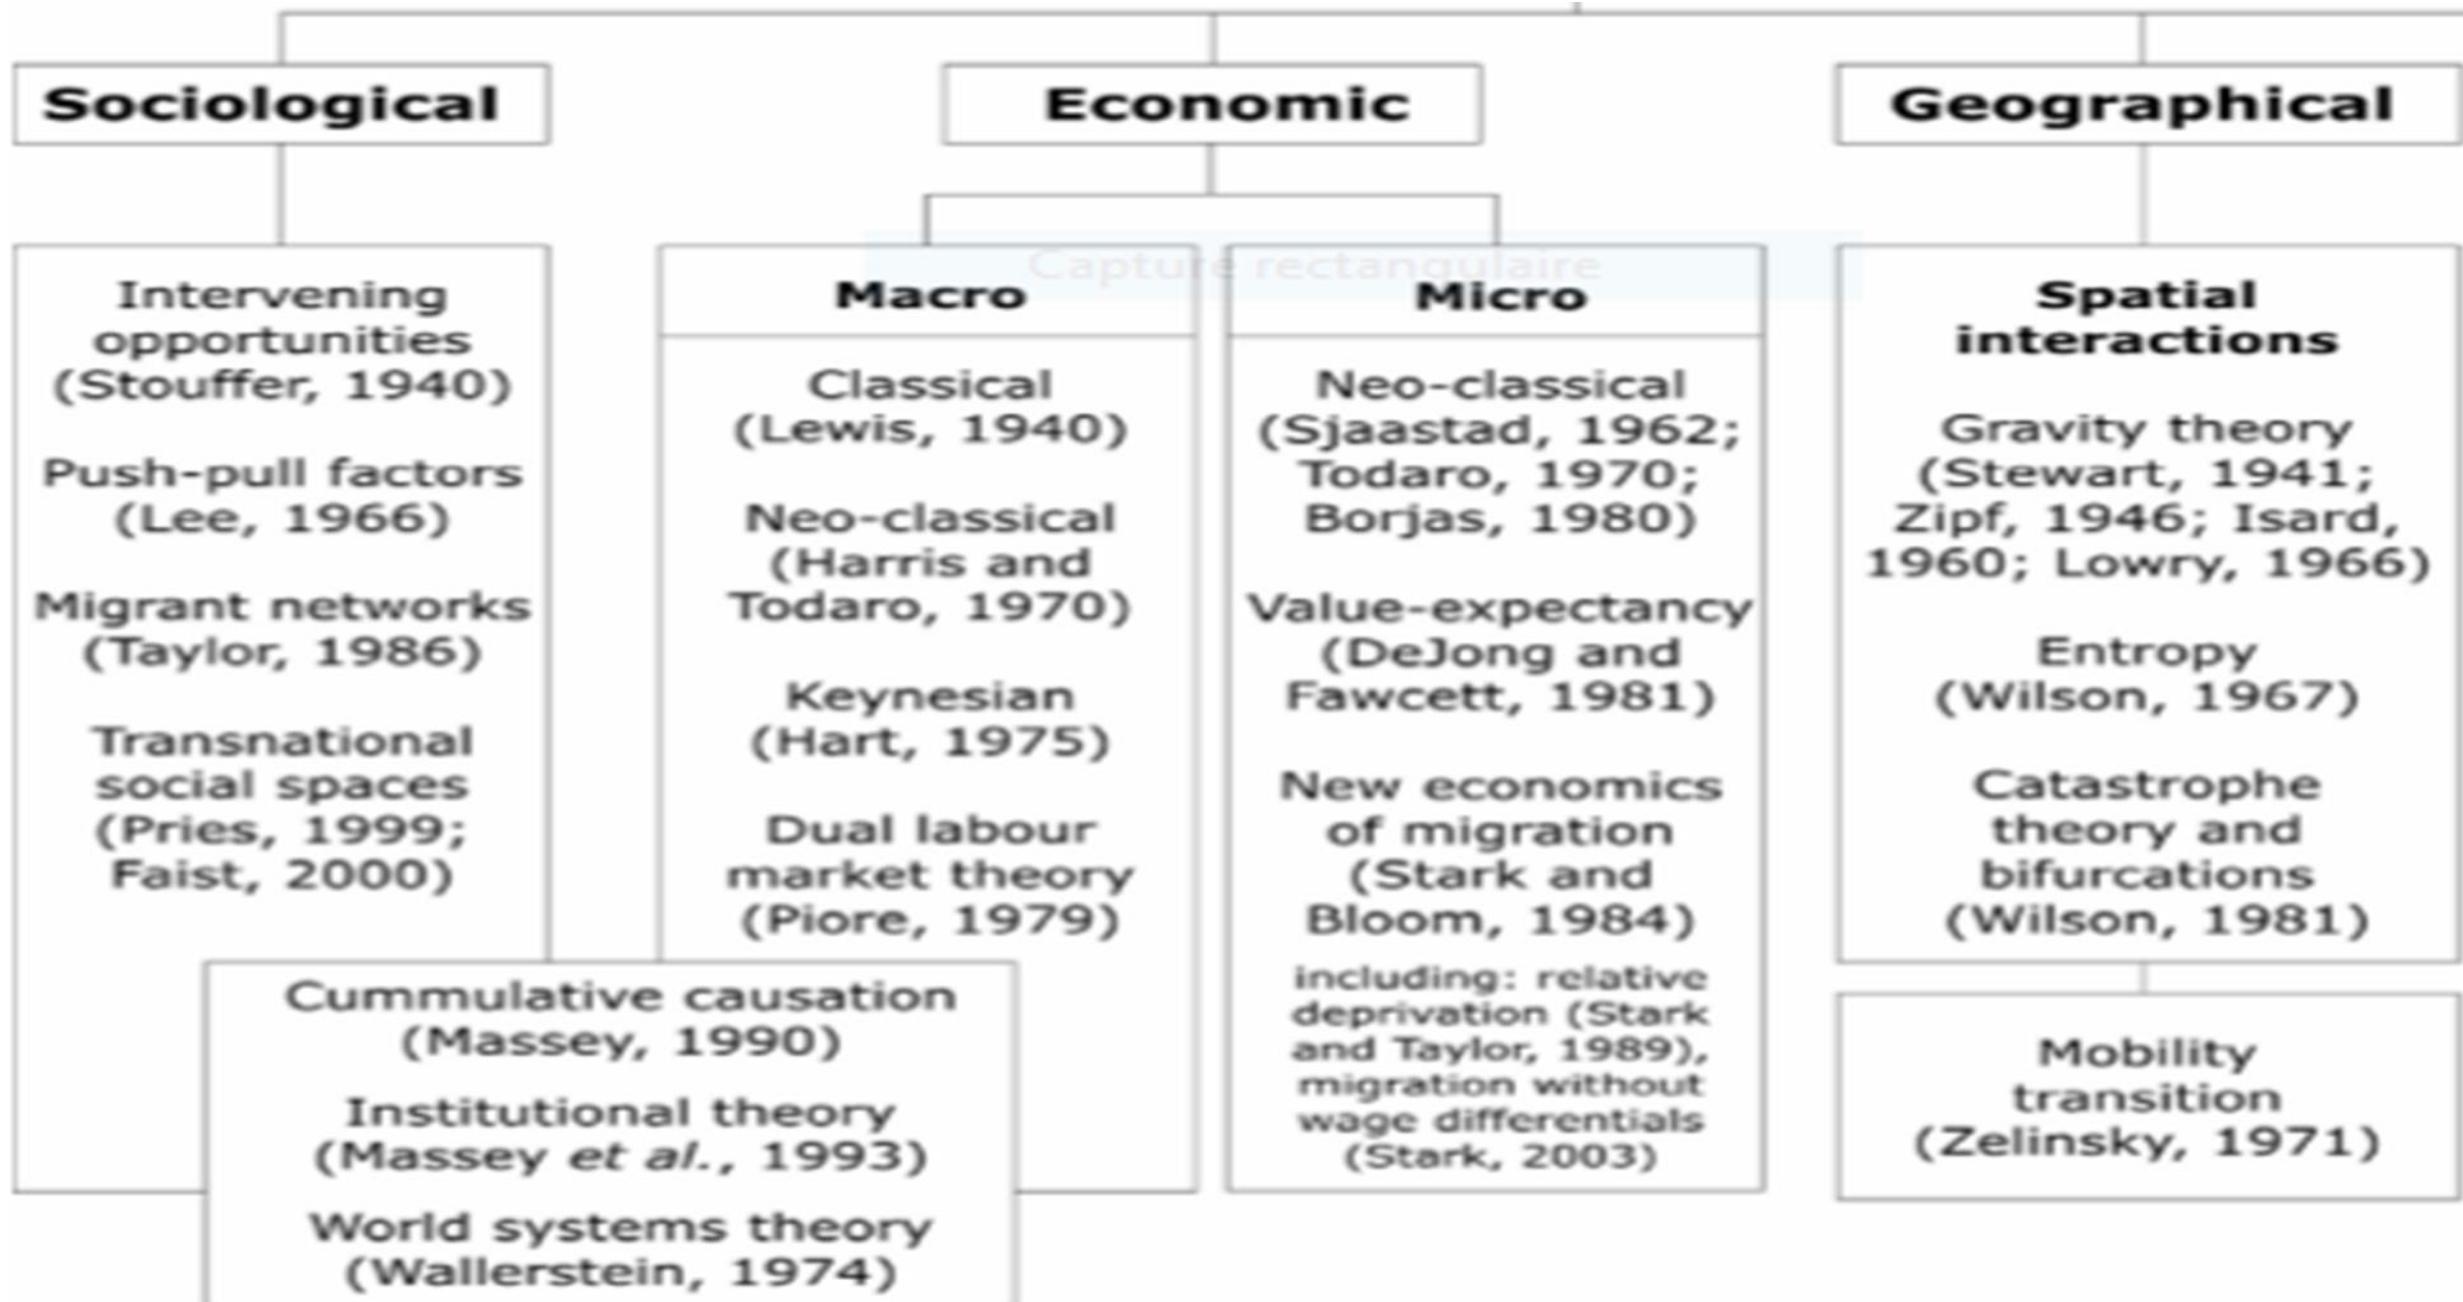

(IOM, 2024)

After the Oil-Shock, between 1975 and 1985 the Gulf countries labour force has increased by an average of 7.7 %, which means a 13% annual growth in the number of foreign workers

(Arnold & Shah, (1984)

**Is migration from North Africa to the Middle East still explained by the natural determinants of human migration?**

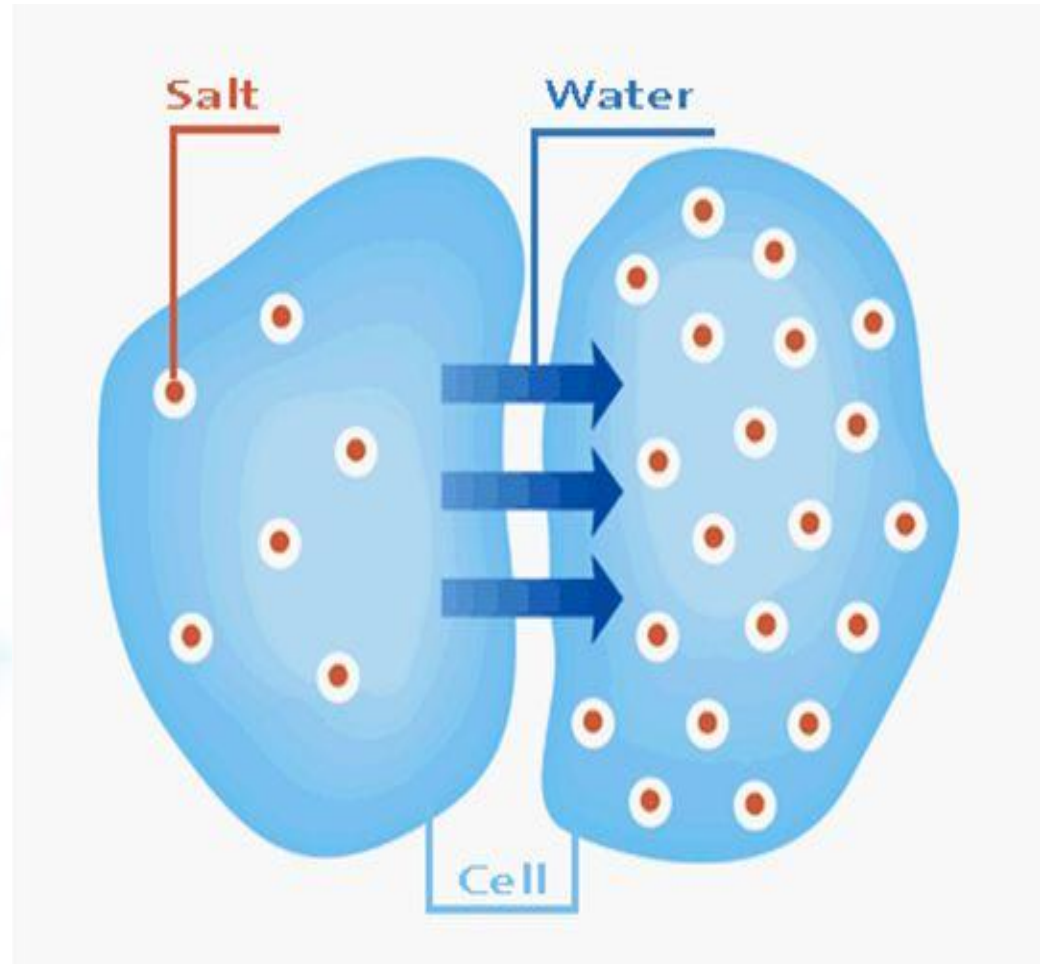

# Causes

# The Global View Methodology

<b>Simple human migration</b>	<b>Diffusion</b>	One million years ago, the diffusion of humans in the planet	Water availability & adequate climate
	<b>Stabilization</b>	10 000 years ago, tribes learned agriculture and occupied almost the entire planet	Security
	<b>Concentration</b>	5000 years ago, sedentary states with big agglomerations	Population density
<b>Complicated human migration</b>		Industrial revolution	Rural urban migration
		Technology	Accelerated migration
		Nationalism	Borders
		colonialism, migration, trade, and religious expeditions	Migration networks
		managing migration flows	Migration policies
<b>New era of human migration</b>		January 2017	Migration ban

# Measuring Human Migration : Osmosis Vs Gravity

# Analogy

## Osmosis Pressure

$$OP = nRT/V$$

**P:** Osmotic pressure

**n:** number of moles of gas in the cell

**R:** Gas constant

**T:** Temperature in kelvins

**V:** Volume of the cell

## Migration Pressure

$$MP = wST/D$$

**MP:** Migration Pressure

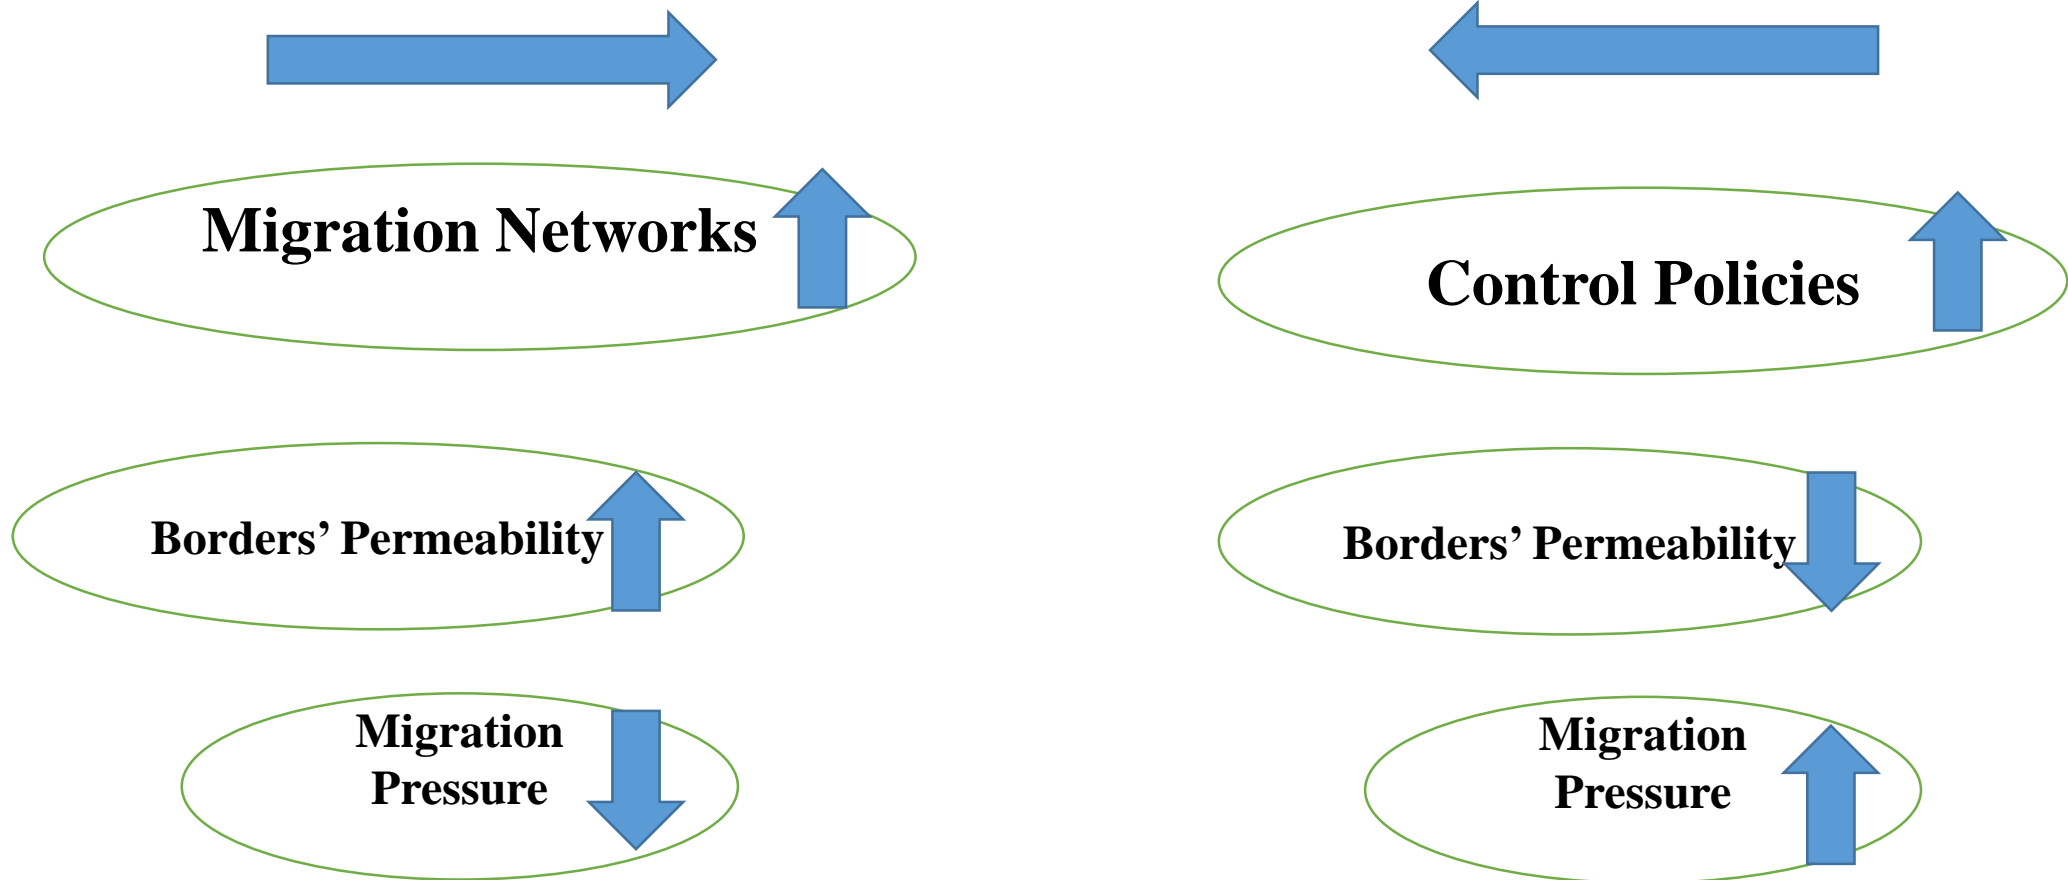

**w:** Water availability

**S:** Security

**T:** Temperature

**D:** Density of population

# Borders' Permeability

# The Model

$$MigPress = \frac{\textit{water.Life Expectancy.Temperature}}{\textit{population density}}$$

- $\log Migij = \mu_0 + \mu_1 \log pressj - \mu_2 pressi + \varepsilon \dots (1)$

## Estimation results of the Fixed effects Panel model

Dependent Variable: Migij	
Models	Fixed Effects
Number of observations	105
Number of groups	5
Pression_j	0.656457 (0.0000)
Pression_i	-0.714989 (0.1049)
Constant	3.202249 (0.0040)
R square	0.889085
F	44.08736

# Conclusion

The socio-economic factors that are considered as the observable factors of migration are the sub-determinants. This means that the root drivers are the natural determinants of human migration that still explain the global migration in the MENA region.

**Thank you**
